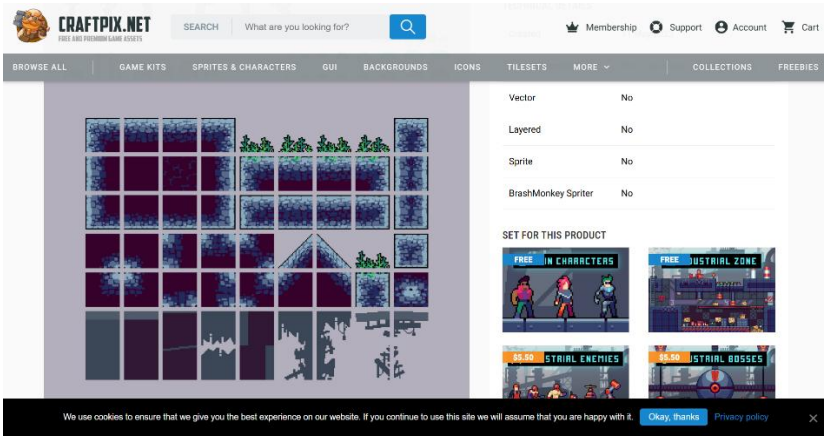
# Process & Decision Documentation

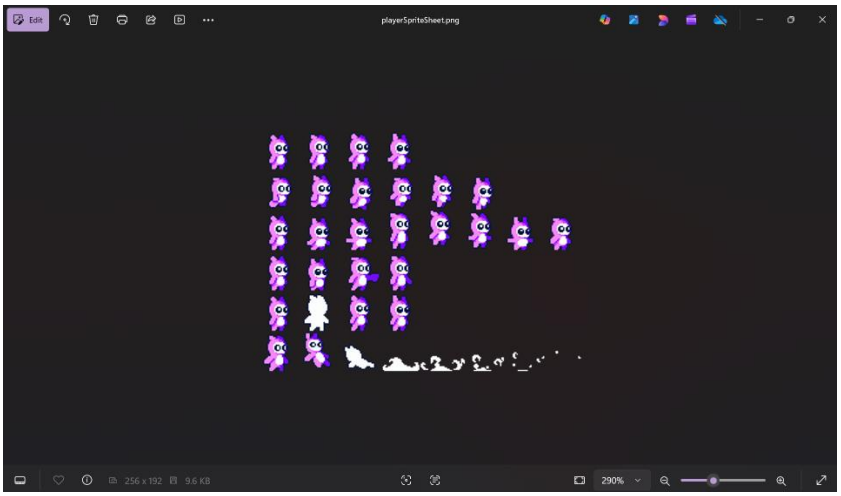
## Project/Assignment Decisions

For this side quest, many of the free online sprite sheets had actions such as idle, run, and attack as separate files. As a result, I decided to combine individual sprite sheet actions into one file. I made this decision after having difficulty with editing the existing code to read the multiple individual actions. By using an online sprite sheet maker to manually combine them myself, I was able to make minimal adjustments to the code for it to work.

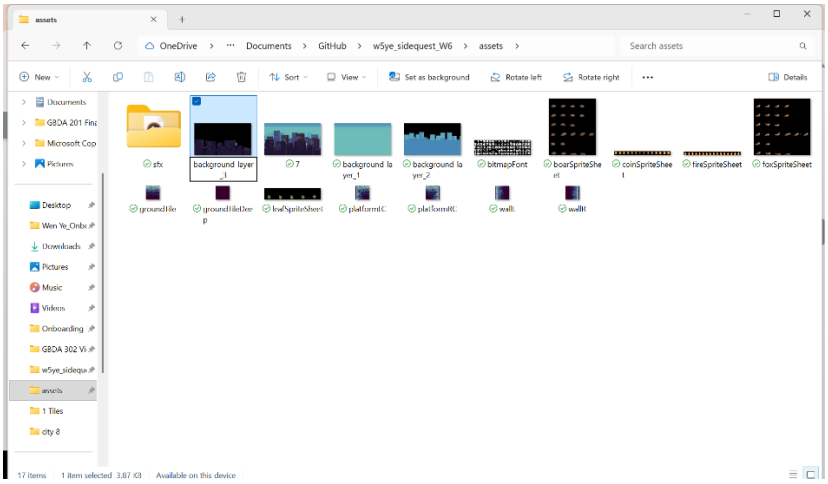
## Role-Based Process Evidence



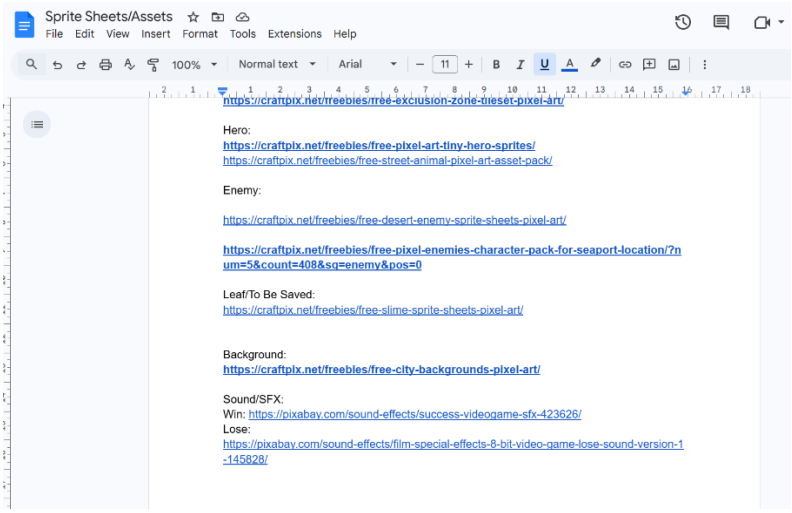
*Screenshot 1: Researched free sprite sheets and assets.*



*Screenshot 2: Combined individual action files into one sprite sheet.*



*Screenshot 3: Renamed files to align with original code*



*Screenshot 4: Stored all resource links in a document for future attribution*

## *GenAI Documentation*

**Date Used**: March 5-6, 2026

**Tool Disclosure**: ChatGPT 5.2

**Purpose of Use**: Learning concepts, debugging, writing code snippets.

**Summary of Interaction**: I provided ChatGPT with some initial code files, asking for clear directions in terms of how to change sprite files and add sound files in the code and then worked with it to debug any issues.

**Human Decision Point(s)**:

- The solutions that ChatGPT provided in order to implement individual action sprite sheets were causing the code to break. To simplify this, I decided to combine the sprite sheets myself and ask ChatGPT to double check that I was doing it correctly.
- ChatGPT would refer to older function/file names in their solutions. I decided to ignore these to prevent inconsistencies within the code. (e.g. I initially wanted to use a dog character, so it kept referring to the playerSpriteSheet as dogSpriteSheet).
- When debugging, I iterated over the solutions provided, since they oftentimes were not complete and did not fix the problem. I decided to provide additional context and flag possible areas/files to check directly.

**Integrity & Verification Note**: All ideas in the modified code were based off my prompts, or personal ideas. I did not use the ChatGPT game code without thorough testing for bugs, usability issues, and other errors. Through various prompt iterations and manual adjustments, I ensured that the result matched the creativity and quality requirements of this Side Quest assignment.

**Scope of GenAI Use**: All code was not used directly without edits and verification of functionality. ChatGPT did not contribute to the selection of sprite sheets and music assets.

**Limitations or Misfires**:

- Cannot handle large/complex coding projects with layers of files, lacks context for what functions are in what file.
- When providing code, ChatGPT often did not include context for what particular file and section the code needed to be in, causing confusion.
- Provided inaccurate advice about sprite sheet combining (e.g. told me to choose the horizontal combine option, when I needed the vertical combine option)
- Struggled to provide clear solutions to debugging errors when linked to multiple files.
- Does not provide simplified explanations for suggested code, lack of “teaching”

*Summary of Process (Human + Tool)*

- Researched free online sprite sheets and sound resources, stored in a document

- Asked ChatGPT how to incorporate sprite sheets and sound resources into the existing game file (pasted AssetLoader.js for reference)
- Solutions for incorporating individual action sprite sheets were causing code issues, attempted to debug inconsistencies and errors. Tested solutions and prompted ChatGPT to verify the functionality of certain files/sections of code.
- Solutions did not work, decided to find other solutions (combining the sprite sheets)
- Asked ChatGPT if my suggested solution was viable
- Worked on debugging additional issues related to sound and identifying which files should be updated accordingly.

### *Decision Points & Trade-offs*

I decided to rename the file names of the new assets that I downloaded for this code. The assets were replaced with the original file names (e.g. tinyplayer -> boarSpriteSheet). I considered keeping the file names or renaming them to ones that were more appropriate. However, due to time constraints and to prevent code errors/inconsistencies, I decided to keep the same file names. By doing so, I was able to reduce the amount of code edits that were required and time spent debugging.

### *Verification & Judgement*

I verified that this decision was appropriate by reviewing the Side Quest assignment document. I ensured that my final code was functional, and that it met the prompt requirements of choosing free online sprite sheets/sounds to update the example code.

### *Limitations, Dead Ends, or Open Questions*

- How can I better use ChatGPT to understand coding concepts quickly?
- Is there a better GenAI tool for handling complex coding projects?
